OOP Project

Project Title: Student Course Management System

نظام إدارة الطلاب :

Problem Statement

In many educational environments, student data is often managed manually or using simple tools, which can lead to errors, data loss, and difficulty in accessing information. This makes it hard to organize student records efficiently and affects the accuracy of tracking grades and course levels.

Objectives

The main objective of this project is to design a simple and organized system to manage student data. It aims to improve data accuracy, provide easy access to student information, and demonstrate the use of Object-Oriented Programming (OOP) concepts in a practical application.

Proposed Solution

The system allows users to add students, display their details, and store data permanently using file handling. It also loads saved data automatically when the program starts. The implementation uses OOP concepts such as abstraction, inheritance, and polymorphism to ensure better code organization and reusability.
